Subject

The present invention is directed to providing ~~To provide~~ an image scanner and an optical recognition system using said image scanner which can scan only the "intended region" to carry out character recognition and can carry out character recognition ~~at~~ in the background of an application software and can input the recognition result directly to said application software.

~~Means to solve the subject~~ Image picture data which are ~~get~~ captured by scanning the "intended region" of a document with the image scanner mouse 20 are converted to text data by a character recognition software in the personal computer 10 and are inputted directly to an application software. Designation and confirmation of input starting position for the "intended region" on a document are made easily and surely with the LCD26 at hand on the image scanner 20.

~~Selection Drawing~~ **Figure 1**
